2. Project Title

Cutting Edge Salon Management & Booking System

3. Problem Statement

Element	Response
---------	----------

Current Situation	Cutting Edge Salon currently uses manual, paper-based diaries and telephone calls to manage daily store operations and appointment bookings.
Problem	This results in mismanagement of daily store operations, including double bookings, missed customer appointments, lost contact details, and difficulty managing stylist availability and service promotions.
Affected Users	The problem affects the salon owner, stylists, and customers.
Consequences	The owner cannot efficiently track daily revenue, staff schedules, or service demand. Stylists experience overlapping bookings. Customers cannot view service prices, availability, or book appointments outside operating hours (Weekdays 9:00-18:00, Saturdays 8:30-17:00, Sundays 08:30 -13:00).
Need	An improved solution is needed to automate the booking process, showcase services and pricing online, reduce administrative errors, and provide a seamless "luxury" experience.

Complete Problem Statement: The organisation currently uses manual, paper-based diaries and telephone calls to complete daily store operations and appointment bookings. This results in mismanagement of daily store running, double-bookings, missed customer appointments, and lost contact details. The problem affects the salon owner, stylists, and customers because appointments cannot be managed efficiently. An improved solution is needed to automate the booking process, showcase services and pricing online, reduce administrative errors, and provide a seamless "luxury" experience.

4. Purpose, Aim and Objectives

4.1 Purpose

The purpose of this project is to develop an integrated, web-based and mobile-friendly management system that replaces the manual paper-based process at Cutting Edge Salon with an automated, centralised digital solution.

4.2 Aim

To streamline Cutting Edge Salon's daily operations, improve customer satisfaction, and increase revenue by providing a seamless online booking and service showcase experience.

4.3 Objectives

1. Design and implement an online booking portal that allows customers to view available time slots and stylists, reducing booking errors by eliminating manual double-booking.
2. Develop an admin dashboard for the salon manager to monitor appointments, manage stylist schedules, and track daily sales.
3. Create a service catalogue displaying all services with accurate pricing and durations (standard haircut = 40 min, Cut & Dye = 1h 15min).
4. Enable customers to select their preferred payment method (cash or card) upon booking to allow staff to prepare accordingly upon customer arrival.
5. Enable customers to cancel their bookings online before the appointment time, empowering users and reducing administrative burden on staff.
6. Integrate automated confirmation notifications via email to reduce no-show rates.
7. Ensure a "luxury" user interface that reflects the salon's brand identity, appealing to their target market (ages 10–30).
8. Promote the "Cut and Dye" service as the flagship offering.

5. Project Scope

Scope Element	Details
Project Title	Cutting Edge Salon Management & Booking System
Aim	To develop an integrated prototype for managing salon bookings, showcasing services, and promoting the "Cut and Dye" service.

Objectives	Allow customers to book online; select payment method (cash/card); cancel bookings online; allow staff to manage schedules; promote specific services (Cut & Dye); display gallery of previous hairstyles.
Deliverables	Flutter web/mobile frontend, ASP.NET backend API, Supabase database, Admin dashboard, GitHub repository, Microsoft Project schedule, SRS document, Excel Progress Tracker.
Acceptance Criteria	A customer must be able to book an appointment end-to-end; select a payment method (cash or card); cancel their booking online; the admin must be able to view and manage all bookings; the system must prevent double bookings; the system must display a "luxury" aesthetic.
Exclusions	WhatsApp Business API (stakeholder confirmed "NO"); full Point-of-Sale (POS) hardware integration; advanced accounting/payroll systems; offline mode; online payments in Phase 1.
Constraints	Must be developed using Flutter, ASP.NET Core, and Supabase; project must be completed within the semester; no paid third-party APIs for core functionality.
Assumptions	The stakeholder will provide professional photos and brand colours; the target users (ages 10-30) have basic digital literacy and stable internet access; the stakeholder will be available for feedback and validation.

6. Deliverables and Acceptance Criteria

Deliverable	Acceptance Criteria
Initial SRS Document	Submitted as one PDF. Contains all required sections. Approved by the lecturer.

Working Web/Mobile Application	The system must be accessible via a browser. Customers must be able to book an appointment end-to-end without assistance. Customers must select a payment method and cancel bookings.
Source Code (GitHub)	All code committed to a shared GitHub repository with a working link provided to the lecturer.
Supabase Database Setup	Database configured with tables for Users, Bookings, Services, Stylists, Payment Methods, and Cancellation Records. Screenshot included in the SRS appendix.
Admin Dashboard	The manager must be able to view, create, edit, and delete appointments and stylist profiles. Must be able to track payment preferences and process cancellations.
Project Progress Tracker	Completed Excel workbook with task progress, individual contributions, and stakeholder engagement logs.
Microsoft Project Schedule	.mpp file showing the timeline from August to project handover.

7. Exclusions, Constraints and Assumptions

Exclusions

- The system will not handle complex retail inventory management for products in this phase (only service booking is prioritised).
- No WhatsApp Business API integration (stakeholder explicitly confirmed "NO" to WhatsApp for bookings).

- No offline mode will be supported.
- Online payments will not be implemented in Phase 1.

Constraints

- **Technology Stack:** Must be developed using **Flutter**, **ASP.NET**, and **Supabase**.
- **Time:** Initial SRS due by 25 August 2026.
- **Budget:** Free tiers of SMTP and Maps APIs will be utilised.

Assumptions

- Salon staff and customers have basic digital literacy and stable internet access.
- The stakeholder will provide professional photos and brand colours.
- Standard haircuts take 40 minutes; Cut & Dye takes 1 hour 15 minutes.
- All stylists offer the same services.
- Customers will have access to the internet to book and cancel appointments.
- The salon will have staff available to manage bookings and cancellations through the admin dashboard.

8. Stakeholders and User Groups

Stakeholder/User	Role & Description
------------------	--------------------

Salon Manager (Owner)	Primary stakeholder. Has full administrative rights to manage stylists, view all bookings, generate reports, and update service information. Needs to solve mismanagement of daily store running.
Stylist (Service Provider)	All stylists offer the same services. They need to view their personal daily schedule.
Customer (End-User)	Target market (ages 10-30, catering to men/women/children). Need to view services, prices, and book appointments online. Expects a "Luxury" feel. Must be able to select payment method and cancel bookings.
Competitors	Legendary Barber (identified as the main competitor).

9. Current Process and Diagram

9.1 Current Process Description

1. **Customer Inquiry:** Customer calls (0787676599) or walks in to ask about service availability, prices, or booking times.
2. **Manual Checking:** Staff manually check a physical diary to see if the requested date and stylist are free.

3. **Verbal Booking:** If available, staff write the customer's name and contact details into the diary. No digital record exists.
4. **Service Delivery:** Customer arrives at 10 Melck Street, Pioneer Building, Welkom Central. No pre-notification system.
5. **Payment:** Handled manually in-store.
6. **Result:** If the customer does not show up, the slot is wasted. No data to analyse peak times.

9.2 Current Process Diagram

Figure 1: Current manual booking process at Cutting Edge Salon

9.3 Proposed (To-Be) Process Flow

The proposed To-Be Process represents the ideal automated workflow for Cutting Edge Salon, designed to eliminate the manual mismanagement identified in the current process. The flowchart is divided into three distinct actors: the Customer, the System, and the Manager.

1. Customer Flow

The process begins when a customer visits the Cutting Edge website (built with Flutter). They can:

- View the service catalogue – Hair Cutting, Hair Colouring, Beard Shaving, and Hot Towel Treatment, with clear pricing and durations (Standard haircut = 40 minutes; Cut & Dye = 1 hour 15 minutes, as per interview).
- View stylist profiles – All stylists offer the same services, allowing customers to choose based on preference.
- Select a service, date, and time that suits their schedule, with real-time availability displayed.

- Select their preferred payment method (cash or card) upon booking to allow staff to prepare accordingly upon customer arrival.

2. System Logic – Conflict Detection (The Core Improvement)

Once the customer submits their selection, the [ASP.NET](#) backend performs a critical function: **Conflict Detection**.

- If available: The system proceeds to capture the customer's name and contact details. The booking is confirmed and stored in the Supabase SQL database, including payment method preference. An automated confirmation email is sent immediately, followed by a reminder email 24 hours before the appointment to reduce no-shows (a key stakeholder request).
- If not available: The system immediately suggests alternate times or stylists. If the customer accepts an alternate, the flow rejoins the booking path. If they decline, the session ends without a booking.

3. Customer Cancellation Flow

The system provides customers with self-service cancellation capabilities:

- **Customer initiates cancellation:** Customer logs into the system and views their upcoming bookings.
- **Customer selects booking to cancel:** Customer selects the booking they wish to cancel and confirms cancellation.
- **System processes cancellation:** The system validates the cancellation request, updates the booking status to "cancelled," restores the stylist's availability for that time slot, and sends a cancellation confirmation email to the customer and notification to the salon manager.
- **Manager is notified:** The admin dashboard reflects the cancellation in real-time, and the manager receives a notification.

4. Manager Flow

In parallel, the salon manager uses a secure Admin Dashboard ([ASP.NET](#) web application) to maintain the system:

- View and manage all bookings – Monitor daily appointments, approve, cancel, or reschedule as needed. Track customer payment method preferences
- Update stylist schedules – Assign working hours (Weekdays 9:00 – 18:00, Saturdays 8:30 – 17:00, Sundays 08:30-13:00).
- Add promotions – Create monthly specials, holiday offers, and birthday discounts to promote specific services like "Cut and Dye" – the stakeholder's flagship service.
- Process cancellations — View cancelled bookings, track cancellation trends, and manage availability restoration.

Explanation of the Proposed Process Flowchart

The proposed To-Be Process represents the ideal automated workflow for Cutting Edge Salon, designed to eliminate the manual mismanagement identified in the current process. The flowchart is divided into three distinct actors: the Customer, the System, and the Manager.

Key Improvements Over the Current Process

Current (As-Is) – Manual	Proposed (To-Be) – Automated
Paper diary	Centralised digital database (Supabase)
No conflict checking	Automated double-booking prevention
No confirmation/reminders	Automated email confirmations & reminders
No customer self-service	24/7 online booking with cancellation capabilities
No promotional management	Admin dashboard for promotions
No data backup	Secure, backed-up cloud storage

Current (As-Is) – Manual	Proposed (To-Be) – Automated
No payment preference tracking	Payment method selection (cash/card)

• How This Addresses the Stakeholder's Needs

Stakeholder Request	How the Proposed Process Fulfils It
"To alleviate mismanagement of daily store running"	Centralised digital management eliminates manual errors.
"To allow for a smooth booking system"	24/7 online booking with conflict detection ensures seamless scheduling.
"Customers must book appointments online"	Customer flow allows easy self-service booking.
"Promote Cut and Dye the most"	Manager can add targeted promotions via the dashboard.
"Luxury feel"	Automated confirmations and reminders enhance the premium customer experience.
"Customer should select payment method"	Customers select cash/card upon booking; staff prepares accordingly.
"Customers must cancel their order"	Self-service cancellation empowers customers and reduces admin burden.
"Prevent double bookings"	Conflict detection system ensures no overlapping appointments.

- This proposed workflow directly addresses the stakeholder's need to **"alleviate mismanagement of daily store running"** and deliver a **"luxury"** experience to their customers, as explicitly requested during the interview, while incorporating lecturer-advised enhancements: payment method selection and customer cancellation.

10. Product Perspective

The **Cutting Edge Salon Management System** is a new, standalone web and mobile application intended to replace the current manual diary and spreadsheet system.

- **System Interfaces:** Integrates with Google Maps (10 Melck Street, Pioneer Building, Welkom Central) and an SMTP/Email service.
- **User Interfaces:** A responsive, "Luxury" themed UI built with Flutter. Includes Public Frontend (Home, About Us, Services, Pricing, Our Team, Gallery, Booking, payment method selection, Customer Cancellation) and Secure Admin Backend (Payment Tracking , Cancellation Management).
- **Communication Interfaces:** HTTPS protocols for all API calls.

11. Main Flutter, ASP.NET and Supabase Functions

Component	Main Functions
Flutter	FRONTEND: Builds a responsive web and mobile UI for customers. Manages navigation across required pages. Handles client-side form validation for booking. Displays payment method selection (cash/card). Provides a customer cancellation interface. Displays Google Maps integration for salon location. Provides the "Luxury" aesthetic required by the stakeholder. Displays real-time availability of stylists and time slots. Shows service catalogue with pricing and durations. BACKEND: Manages local state and caching for improved performance. Handles direct CRUD operations with Supabase (customers can view services, stylists, and create bookings, select payment methods, cancel bookings). Implements client-side logic for booking flow. Manages local notifications. Validates booking data before submission. Handles error handling and user feedback. Manages offline-friendly features where applicable.
ASP.NET Core	FRONTEND: Builds a secure, responsive web-based admin dashboard for the salon manager. Provides an interface for managing all bookings (view, create, edit, delete). Tracks payment method preferences. Manages cancellations and availability restoration. Manages stylist profiles (add, edit, delete) for stylists. Displays daily sales tracking and revenue reports. Allows creation of promotions and service updates to promote "Cut and Dye" as the flagship service. Provides access to customer data and appointment history. Displays operating hours. BACKEND: Provides secure RESTful API endpoints for the admin dashboard (if needed). Implements JWT authentication for manager access control. Contains core administrative business logic (manager-level conflict detection, booking management, cancellation processing, payment tracking). Handles data sanitization and validation for all admin operations. Manages email automation (confirmation, cancellation, and reminder emails 24 hours before appointments) via SMTP integration. Generates sales reports and analytics for the manager. Enforces role-based access

	control (only managers can access admin features). Manages secure data operations with Supabase.
Supabase (Database/Auth/Storage)	SQL database stores Users, Stylists, Services, Bookings, Payment Methods, Cancellation Records. Built-in Authentication (Row Level Security). Real time subscriptions. Stores uploaded images.

12. Functional Requirements

ID	Requirement	Priority
FR-01	The customer must be able to view the service catalogue with prices and durations.	Must
FR-02	The customer must be able to view available stylist profiles	Must
FR-03	The customer must be able to book an appointment by selecting a Stylist, Date, and Time.	Must

FR-04	The system must prevent double bookings (conflict detection for the same stylist at the same time).	Must
FR-05	The system must send a confirmation email after a booking is created.	Must
FR-06	The manager must be able to view, modify, or cancel any booking through the admin dashboard.	Must
FR-07	The manager must be able to add, edit, and delete stylist profiles.	Must
FR-08	The customer must be able to cancel their booking online before the appointment time.	Must
FR-09	The system should send automated appointment reminders (e.g., 24 hours before).	Should
FR-10	The system must display the physical address (10 Melck Street, Pioneer Building, Welkom Central), contact number (0787676599), and email (cutinged@88@gmail.com).	Must
FR-11	The system must include Google Maps integration to show the salon location.	Must
FR-12	The system must include functional links to social media (Instagram, Facebook, TikTok).	Must
FR-13	The system must allow customers to view a gallery of previous hairstyles and salon work.	Should
FR-14	The system must include the following pages: Home, About Us, Services, Pricing, Our Team, Gallery, Booking.	Must
FR-15	The system must promote the "Cut and Dye" service as the flagship offering.	Must
FR-16	The system must display operating hours: Weekdays 9:00-18:00, Saturdays 8:30-17:00, Sunday 8:30-13:00.	Must

FR-17	The system must display parking information: "Free parking available."	Should
FR-18	The customer must be able to select their payment method (cash or card) when booking an appointment.	Must

13. Non-Functional Requirements

ID	Requirement
NFR-01	The UI must reflect a "Luxury" feel and be easy to navigate for users aged 10-30.

NFR-02	Page load time must not exceed 3 seconds on a standard broadband connection.
NFR-03	User passwords must be hashed and stored securely via Supabase Auth. Session tokens must expire.
NFR-04	The system must be available 99% of the time.
NFR-05	ASP.NET code must follow clean architecture principles and contain clear comments.
NFR-06	Only authorised staff (managers) must be able to access the administration dashboard.
NFR-07	Error messages must be clear, understandable, and user-friendly.
NFR-08	The prototype must use test data instead of real customer information during development.

14. System Requirements

ID	Requirement
----	-------------

SR-01	The mobile/web frontend must be developed using Flutter .
SR-02	The backend API must be developed using ASP.NET Core .
SR-03	The shared database and authentication must use Supabase (PostgreSQL).
SR-04	The source code must be stored in a GitHub repository.
SR-05	The application must be accessible via modern browsers (Chrome, Firefox, Safari) on desktop, tablet, and mobile.
SR-06	The system must use test data during development and staging phases.

15. Integration Requirements

ID	Requirement
IR-01	Information entered through Flutter must be stored in Supabase.
IR-02	Records stored in Supabase must be available to the ASP.NET application.
IR-03	Updates made through ASP.NET must be reflected in Flutter where applicable (real-time booking updates).
IR-04	The system must integrate with Google Maps API to display the location of 10 Melck Street, Pioneer Building, Welkom Central.
IR-05	The system must integrate with an SMTP/Email service (e.g., SendGrid or Gmail SMTP) to send confirmation, cancellation, and reminder emails.
IR-06	The system must integrate social media links (Instagram, Facebook, TikTok) on the website.

16. Requirements Prioritisation (MoSCoW)

Priority	Requirements
Must Have (Essential)	Core Booking (FR-03), Conflict Prevention (FR-04), Admin Dashboard (FR-06), Service Catalogue (FR-01), Google Maps (FR-11), Display Contact Info (FR-10), Required Pages (FR-14), Promote "Cut and Dye" (FR-15), Display Hours (FR-16), Customer Cancellation (FR-08), Payment Method Selection (FR-18)
Should Have (Important)	Email Reminders (FR-09), Customer Self-Cancellation (FR-08), Gallery (FR-13), Social Media Links (FR-12), Parking Info (FR-17).
Could Have (If Time Permits)	Online Product Purchases, Advanced Sales Analytics, Customer Reviews.
Won't Have (This Phase)	WhatsApp API Integration (stakeholder confirmed "NO"), Online Payments, POS Integration.

17. Appendices Containing Stakeholder Evidence

Appendix A: Interview Questions and Responses (Full Transcript)

(If the images are not visible, please refer to the evidence folder)

Barber Website — Interview

Salon Name: Cutting Edge
Owner/Manager Interviewed: Salah, Nabeel
Date of Interview: 11 April 2022

Business & Purpose

1. What is the main goal of the website?
To showcase our products and services and to allow for a smooth booking system

2. What was the date established?
11 April 2022

3. What are the main goals of the website?
To showcase our products and services and to allow for a smooth booking system

4. What problem do you want the website to solve?
To solve the mismanagement of my store running

5. What do you want customers to be able to do on the website?
To view the services and products and book appointments

6. Who are your main competitors?
Local barbers

7. What makes your salon different from competitors?
High quality service and product range, allowing it to stand out from the rest

8. What do you want customers to think/feel when they visit the website?
Convenience

Target Customers

9. Who is your target market?
Everyone who wants to maintain their style and hygiene

10. What age groups do you mainly serve?
Everyone over 16

11. Do you cater to men, women, children, or everyone?
Everyone

12. What are the most common services customers ask for?
Cut and dye

13. What information do customers usually ask for before visiting?
Prices and booking time

Services & Pricing

14. What services does the salon offer?
Hair cutting, hair coloring, beard shaving, hot towel treatment

15. What is the price of each service?
From \$15 to \$25

16. How long does each service usually take?
From 15 to 30 minutes

17. Do prices differ depending on hair length, style, or other factors?
Yes

18. Are there any packages or specials?
Yes

19. How often do you introduce promotions?
Once a month

20. Which services do you want to promote most?
Cut and dye

Appointments & Booking

21. Should customers be able to book appointments online?
Yes

22. What information should customers provide when booking?
Name and contact details

23. Should customers select a specific stylist?
Yes

24. Should customers be able to choose a date and time?
Yes

25. Should the system prevent double bookings?
Yes

26. Should customers receive a confirmation after booking?
Yes

27. Should customers receive appointment reminders?
Yes

28. Can customers cancel or reschedule appointments online?
Yes

29. How far in advance can customers make bookings?
2 weeks

30. Do you require a deposit before confirming an appointment?
Yes

31. What happens if a customer doesn't arrive for their appointment?
Those services will be charged but not completed

Payments

32. Will customers be able to pay online?
Yes

33. Which payment methods do you accept?
Cash, credit cards, and EFT

34. Do you require a deposit?
Yes

35. Should the website display payment instructions?
Yes

36. Should customers receive proof/confirmation of payment?
Yes

Staff

37. How many stylists/workers are there?
5

38. Do you want each stylist to have a profile on the website?
Yes

39. Should customers be able to choose a specific stylist?
Yes

40. What information should appear about each stylist?
Full name and contact details and their availability

41. Do different stylists offer different services?
Yes, they all offer the same services

42. What are the working hours of each stylist?
From 9am to 7pm, 7 days a week

Salon Information

43. What is the physical address?
100 Main Street, Perth, Western Australia

44. What are the opening hours?
9am - 7pm

45. What is the contact number?
08 123 4567

46. What email address should customers use?
info@cuttingedge.com.au

47. Do you have WhatsApp for bookings?
Yes

48. Do you have social media accounts?
Yes

49. Do you want Google Maps location integrated?
Yes

50. Do you offer parking or any other facilities customers should know about?
Free street parking available

Website Pages

51. What pages do you want?
Home, About Us, Services, Pricing, Our Team, Gallery, Booking

52. Content Us
Promotions/Specials
FAQs
Reviews/Testimonials

Design & Branding

53. Do you have specific brand colours?
Yes, black and gold

54. Do you have a preferred font style?
Yes

55. What kind of look do you want: elegant, modern, basic, rustic, minimalist, coloured, etc?
Modern and elegant

56. Are there colours or designs you don't want?
Yes, anything too busy or cluttered

57. Do you have professional photos of the salon and staff?
Yes

58. Are you happy for us to use stock images where necessary?
Yes

Gallery & Social Media

59. Do you want a gallery of previous hairstyles/work?
Yes

60. How frequently will new photos be added?
Regularly

61. Do you want Instagram/Facebook/TikTok links?
Yes

62. Do you want social media posts displayed on the website?
Yes

Reviews & Testimonials

63. Do you want customers to see reviews?
Yes

Key Extracts:

- **Salon Name:** Cutting Edge
- **Established:** 11 April 2022
- **Main Problem:** "To alleviate mismanagement of daily store running."
- **Main Goals:** "To showcase our products and services and to allow for a smooth booking system."
- **Target Audience:** 10 – 30 years old, everyone (Men, Women, Children).
- **Core Services:** Hair cutting, hair colouring, beard shaving, hot towel treatment.
- **Brand Vibe:** "Luxury."

- **Competitor:** Legendary Barber.
- **Desired Pages:** Home, About Us, Services, Pricing, Our Team, Gallery, Booking.
- **Operating Hours:** Weekdays 9-6, Saturdays 8:30-5.
- **Address:** 10 Melck street, pioneer building, Welkom Central.
- **Contact:** 0787676599 / cuttinged@88@gmail.com
- **Stylists:** All offer the same services.

Appendix B: Interview Meeting Evidence (Photos)

Caption: Interview conducted with Cutting Edge Salon owner/manager on 18 August 2026.

Caption: Discussion of current booking process and manual diary.

Caption: Front view of Cutting Edge Salon at 10 Melck Street, Welkom.

Appendix C: Stakeholder Confirmation of Findings

We summarised the main findings at the end of the interview and asked the stakeholder to confirm that our understanding was correct.

Summary Confirmed:

- The current manual diary system is inefficient and causes mismanagement.
- The stakeholder wants customers to book online.
- The stakeholder wants a "Luxury" feel.
- The stakeholder does NOT want WhatsApp bookings.
- The stakeholder has stylists who all offer the same services.
- The stakeholder wants pages: Home, About Us, Services, Pricing, Our Team, Gallery, Booking.

UNIT 2

Feasibility and Risk Analysis

Cutting Edge Salon Management & Booking System

Conduct a Feasibility Study

Review Your Current Project

Question	Group Response
What is the main problem being addressed?	Cutting Edge Salon currently uses manual, paper-based diaries and telephone calls to manage daily store operations and appointment bookings. This results in double bookings, missed customer appointments, lost contact details, and difficulty managing stylist availability and service promotions.
What are the main Flutter functions?	• Service catalogue display with pricing and durations • Stylist profiles viewing • Online booking with date/time selection • Payment method selection (cash or card) upon arrival • Customer cancellation functionality • Google Maps integration • Gallery viewing • Luxury UI with brand identity • Contact information display • Social media links
What are the main ASP.NET functions?	• Admin dashboard for booking management • Stylist profile management (CRUD) • Conflict detection logic for double-booking prevention • Booking cancellation processing • Payment method tracking • JWT authentication • Email confirmation sending • Promotions management • Report generation
What information will Supabase manage?	• Users (managers, stylists, customers) • Bookings (customer name, contact details, stylist, service, date, time, status, payment method, cancellation status) • Services (name, description, duration, price) • Stylists (name, photo, availability)

	• Promotions (title, description, dates) • Gallery images
Which functions appear most difficult?	• Real-time conflict detection logic • Supabase integration with ASP.NET • Email notification integration • Customer cancellation processing and availability updates • Google Maps API integration • Admin dashboard with full CRUD operations • Professional luxury UI design
Which functions require skills the group still needs to develop?	All group members have practical experience in Flutter, ASP.NET, and Supabase from previous coursework. The group consists of Three members who are particularly strong with coding and 2 members who are skilled in documentation, UML diagrams, and code design. To further enhance our skills and stay current with industry practices, four group members have enrolled in the GenAI course conducted by Ms Lonergan, which covers advanced topics including Supabase integration with ASP.NET. The knowledge gained will be shared across the entire group to ensure all members benefit.
Which functions may require more time than is available?	• Gallery management system • Promotions management dashboard • Advanced reporting functionality

Evaluate Technical Feasibility

Question	Group Finding
Does the group have the required Flutter skills?	Yes - All group members have practical experience from previous coursework. 3 members are particularly strong with coding and have practical Flutter experience. The other 2 members, skilled in design and documentation, also have practical experience with Flutter concepts.
Does the group have the required ASP.NET skills?	Yes - All group members have practical experience from previous coursework. 3 members are particularly strong with coding and have practical ASP.NET experience. The group is well equipped to build the backend API.
Can the group work with Supabase?	Yes - All group members have practical experience with Supabase from previous coursework. To further strengthen our skills and stay current with best practices, four group members have enrolled in the GenAI

	course conducted by Ms Lonergan, which provides advanced training on Supabase integration with ASP.NET. The enrolled members will share learnings with the entire group.
Can Flutter and ASP.NET connect to the same Supabase backend?	Yes - Both can connect to Supabase via REST APIs and PostgreSQL connections. The group has the necessary practical experience to implement this integration effectively.
Are suitable development computers available?	Yes - All group members have personal computers capable of running Visual Studio, VS Code, Flutter SDK, and .NET Core
Are suitable test devices available?	Yes - Group members have various devices including Android phones, iPhones, and laptops for testing web/mobile responsiveness
Is reliable internet access available?	Yes - All group members have access to stable internet connections for development and research
Which technical skills are being enhanced?	• Supabase integration with ASP.NET • JWT authentication implementation • Supabase RLS policies (being enhanced through the GenAI course) • Integration testing between Flutter and ASP.NET • Email service configuration (SMTP/SendGrid) • Payment method tracking logic • Cancellation workflow implementation
Which functions may require careful implementation?	• Advanced conflict detection with real time updates • Comprehensive reporting dashboard • Professional grade email notification system • Cancellation logic and availability restoration • Payment method selection and tracking

Technical Feasibility Decision

Feasible with changes

The project is technically feasible with changes. All group members have practical experience in Flutter, ASP.NET, and Supabase from previous coursework, providing a strong baseline for development. The group includes Three members who are particularly strong with coding and are proficient with ASP.NET, Flutter, and backend logic, ensuring that technical implementation can proceed effectively. Additionally, 2 members are skilled in documentation, UML diagrams, and code design, contributing to high-quality documentation and system architecture.

The additional requirements from the lecturer:

Payment method selection (cash or card) and customer cancellation functionality are technically achievable. Payment method selection is a straightforward data capture enhancement that requires minimal additional development effort. Customer cancellation functionality requires careful implementation of workflow logic, including availability restoration and notification triggers. Both features are within the group's technical capabilities and can be implemented within the semester timeframe.

To further strengthen our technical capabilities and stay current with best practices, four group members have enrolled in the GenAI course conducted by Ms Lonergan, which covers advanced topics including Supabase integration with ASP.NET. The knowledge gained will be shared across the entire group. This demonstrates the group's commitment to professional development and delivering high-quality work.

The functions are achievable within the semester with proper planning, prioritisation, and leveraging the group's strong coding foundation.

Evaluate Operational Feasibility

Question	Group Finding
Will the prototype address the stakeholder's problem?	Yes - The system addresses the core problem of manual diary mismanagement by providing automated booking, conflict detection, centralized digital records, payment method tracking, and customer cancellation capabilities
Who will use the mobile application?	Customers will use the Flutter web/mobile application to view services, book appointments, select payment methods, cancel bookings, and access salon information
Who will use the web application?	Salon manager/owner and stylists will use the ASP.NET web application to manage bookings, view schedules, track payment methods, and update information
Do the intended users have suitable devices?	Yes - Target users typically have smartphones with internet access. The manager has a computer for admin tasks
Do users have suitable internet access?	Yes - Customers will access the system primarily via mobile data or Wi-Fi. The salon has internet connectivity for staff use
Will the proposed solution fit the organization's current activities?	Yes - The system integrates with existing salon operations by digitizing the booking process while maintaining the same service structure. Payment method tracking helps staff prepare for customer arrivals, and customer cancellation reduces staff workload
Will users require guidance or training?	Yes - Staff will need training in using the admin dashboard, and tracking payment

	preferences. Customers will need minimal guidance as the interface will be intuitive
Are any proposed functions unsuitable for the intended users?	The gallery management and promotions dashboard may be too complex for the manager initially; these may need simplification. Cancellation functionality should be straightforward and user-friendly

Operational Feasibility Decision

Feasible with changes

The project is operationally feasible with changes. The proposed system directly addresses the stakeholder's need for improved booking management and provides a "luxury" customer experience. Payment method selection enhances the customer experience by allowing staff to prepare for payment preferences before customer arrival. Customer cancellation functionality reduces administrative burden on staff and improves customer satisfaction by providing self-service options. The users are digitally literate and comfortable with mobile applications. Staff will require training on the admin dashboard. The group will provide clear user documentation and conduct training sessions for the salon manager.

Evaluate Economic Feasibility

Resource	Available?	Action Required
Internet access or data	Yes	No action required - all members have internet access
Transport to the stakeholder	Yes	Public transport available to Welkom Central; group can coordinate visits
Development computers	Yes	All members have suitable development computers
Test devices	Yes	Group members have Android phones, iPhones, and laptops for testing
Required software	Yes	Visual Studio Community (free), VS Code (free), Flutter SDK (free), .NET Core (free)
Supabase resources	Yes	Supabase free tier provides adequate resources for prototype development
Presentation resources	Yes	Microsoft PowerPoint, Google Slides, or Canva available
Other project resources	Yes	GitHub free tier, email services (SMTP free tier), Google Maps API free tier

Economic Feasibility Decision

Feasible

The project is economically feasible. All required resources are available at no cost through free tiers of the necessary services. The group has access to development computers, test devices, and internet connectivity. Supabase provides a generous free tier, and both Google Maps API and SMTP services offer free tiers suitable for prototype development. No significant financial investment is required to complete this project within the semester. The additional features (payment method selection and customer cancellation) do not require any additional financial resources.

Evaluate Schedule Feasibility

Question	Group Finding
Is enough time available for system design?	Yes - The group has allocated time for system architecture and database design during the planning phase
Is enough time available for Flutter development?	Yes - With Three members who are particularly strong with coding can proceed efficiently; the other 2 members can support with design and documentation. Payment method selection and cancellation screens will be integrated into the booking workflow
Is enough time available for ASP.NET development?	Yes - 3 members have strong coding skills and practical ASP.NET experience, allowing for efficient backend development. Cancellation logic and payment method tracking will be implemented as part of the core booking API
Is enough time available for Supabase integration?	Yes - All members have practical experience with Supabase. The GenAI course participation by 4 members further enhances these skills, ensuring smooth integration. Database schema will be updated to include payment methods and cancellation status fields
Is enough time available for testing and corrections?	Potentially limited - The group must allocate sufficient time for testing and bug fixes, including testing cancellation workflows and payment method tracking
Is enough time available for stakeholder feedback?	Yes - Regular stakeholder meetings are scheduled throughout the project
Are too many functions currently included?	Yes - The scope includes 17 functional requirements plus the two new additions (payment method selection and customer

	cancellation), which may be ambitious for the available time
Which functions may need to be simplified, postponed or removed?	• Gallery management (simplify or postpone) • Email reminders (simplify implementation) • Promotions management (simplify) • Comprehensive reporting (simplify)

Schedule Feasibility Decision

Feasible with changes

The project is schedule feasible with changes. The group has strong coding capabilities and practical experience in all required technologies, including Supabase. The GenAI course participation by group members further enhances the group's skills and demonstrates commitment to delivering high-quality work.

The additional requirements: payment method selection and customer cancellation, they are valuable enhancements that will be integrated into the existing booking workflow:

- Payment method selection: Minimal additional development effort; simple data capture enhancement
- Customer cancellation: Moderate additional effort; requires workflow logic and availability restoration

The core booking functionality can be completed within the semester. However, the full scope of 19 functional requirements (17 original + 2 new) may be ambitious given the time available. The group must prioritise the "Must Have" requirements and simplify or postpone "Should Have" features. Payment method selection and customer cancellation will be treated as "Must Have" requirements as they are lecturer advised enhancements.

Evaluate Legal Feasibility

Question	Group Finding
Will the prototype collect personal information?	Yes - The system will collect customer names and contact details for booking purposes
Is all the information necessary?	Yes - Name and contact details are essential for booking confirmation and customer communication. Payment method preference is necessary for staff preparation
Who should be allowed to access the information?	• Manager: Full access to all customer data • Stylists: View their own bookings • Customers: View and cancel their own bookings only
Will test data be used during development?	Yes - The group will use test data during development and staging phases to avoid using real customer information
How will passwords and private keys be protected?	• Passwords hashed using Supabase Auth • API keys stored in environment variables • No credentials in code or GitHub

Does the project involve confidential stakeholder information?	Minimal - The salon's operational information will be used, but no sensitive financial or personal information about the owner
Is private stakeholder information being kept out of GitHub?	Yes - No passwords, API keys, identity numbers, private records, or confidential information will be placed in the public GitHub repository

Legal Feasibility Decision

Feasible

The project is legally feasible. The group will collect only necessary personal information (name and contact details) for booking purposes. Payment method preference is not sensitive personal information and can be collected without additional legal concerns. All sensitive information, including passwords, API keys, and private credentials, will be stored securely in environment variables and not committed to GitHub. The group will use test data during development to avoid exposing real customer or stakeholder information. Row Level Security (RLS) policies in Supabase will ensure appropriate data access controls.

Evaluate Ethical Feasibility

Question	Group Finding
Does the stakeholder understand the purpose of the project?	Yes - The stakeholder was fully briefed during the interview and understands the system's purpose and scope
Is unnecessary personal information being collected?	No - The system collects only necessary information (name, contact details, payment method preference) for booking functionality and staff preparation
Could the proposed solution negatively affect intended users?	No - The system aims to improve the customer experience by providing convenient online booking, self-service cancellation, and reducing appointment errors
Is information being used only for its intended purpose?	Yes - Customer information will be used only for booking management, appointment confirmation, and payment preparation
Does the proposed prototype accurately reflect stakeholder needs?	Yes - The requirements were confirmed with the stakeholder during the interview and findings summary. The lecturer's additional requirements have been incorporated
Are users being treated fairly and responsibly?	Yes - The system will provide equal access to booking services without discrimination. Customer cancellation empowers users with flexibility

Ethical Feasibility Decision

Feasible

The project is ethically feasible. The group has obtained informed consent from the stakeholder and will only collect information necessary for the system's functionality. Payment method selection is a simple preference that enhances service delivery. Customer cancellation empowers users and improves their experience. Customer information will be used only for its intended purpose. The system is designed to benefit both the salon and its customers by providing a fair and accessible booking service. The group will ensure responsible handling of all data collected during the project.

Complete the Feasibility Summary

Feasibility Area	Decision	Main Reason	Change Required
Technical	Feasible with changes	All members have practical experience; 3 members strong with coding; 4 members in GenAI course for skill enhancement	Apply learning from GenAI course; share knowledge across group; simplify complex functions where necessary
Operational	Feasible with changes	Staff need training; new features enhance customer experience	Provide user training; simplify dashboard functions
Economic	Feasible	All resources available at no cost through free tiers	None
Schedule	Feasible with changes	19 requirements may be ambitious; effective time management required	Prioritise Must Have requirements; postpone Should Have features; include payment method and cancellation as Must Have
Legal	Feasible	Data protection measures in place; test data used during development	Use test data and secure credentials.
Ethical	Feasible	Stakeholder informed; only necessary data collected; customer empowerment features included	None

Step 9: Make an Overall Feasibility Decision

The project is feasible with changes.

The main strengths of the project are:

- The core booking functionality directly addresses the stakeholder's need to "alleviate mismanagement of daily store running"
- All group members have practical experience in Flutter, ASP.NET, and Supabase from previous coursework
- The group includes Three members who are particularly strong with coding: Nyakallo Pali, Thabang Zitha, and Bennet Linda and are proficient with ASP.NET, Flutter, and backend logic
- 2 members: Yamkela Mazamane and Goitsoene Kgwele are skilled in documentation, UML diagrams, and code design, ensuring high-quality project documentation
- Four group members have enrolled in the GenAI course conducted by Ms Lonergan, which provides advanced training on Supabase integration with ASP.NET. The knowledge gained will be shared with the entire group
- The proposed solution provides "luxury" customer experience as requested by the stakeholder
- The technical stack (Flutter, ASP.NET, Supabase) is appropriate for the project scope
- All required resources are available at no cost
- The system addresses key stakeholder requirements: online booking, conflict detection, email confirmations, and service promotion
- Payment method selection enhances staff preparation and customer experience
- Customer cancellation empowers users and reduces administrative burden

The main limitations identified are:

- The current scope of 19 functional requirements (17 original + 2 new) may be ambitious for the available semester
- Email notification and Google Maps integration require careful implementation
- Staff training will be needed for the admin dashboard
- Real time conflict detection requires careful design
- Customer cancellation logic requires careful implementation to ensure availability is restored correctly
- One group member is not enrolled in the GenAI course, though the group will share learnings

To ensure that the project can be completed within the semester, the group will:

1. Priorities the 14 "Must Have" requirements (including payment method selection and customer cancellation as lecturer advised enhancements)
2. Simplify or postpone lower-priority requirements where necessary
3. Leverage the group's practical experience and apply learning from the GenAI course for effective Supabase integration; share knowledge across all group members
4. Leverage the 3 members strong with coding for technical implementation while utilizing the 2 documentation focused members for UML diagrams and design
5. Implement integration testing early to identify and resolve technical challenges
6. Schedule regular stakeholder feedback sessions to ensure alignment
7. Monitor project progress weekly using the Microsoft Project schedule and Progress Tracker
8. Remove the following functions if time constraints arise:
 - Gallery management (FR-13) - postpone to future enhancement
 - Automated email reminders (FR-09) - simplify to manual reminders if integration becomes complex
 - Social media integration (FR-12) - can be added as simple links without complex API integration
9. Ensure all important changes are confirmed with the stakeholder before implementation

Prepare a Project Risk Register

Identify Project Risks

Based on the feasibility study findings, project context, and lecturer feedback requiring additional features, the following 10 project-specific risks have been identified:

Project Risk Register

Risk ID	Risk Statement	Category	Likelihood (1-3)	Impact (1-3)	Score	Level	Mitigation	Contingency	Risk Owner	Status
R01	Supabase integration may require additional effort; four members are enhancing skills through the GenAI course	Technical	2	3	6	Medium	Continue participation in GenAI course for the four enrolled members; share learning across the entire group; leverage practical experience; create proof-of-concept early	Seek guidance from lecturer or course resources; use alternative data access methods if needed; the non-enrolled member can still benefit from shared group learning	Nyakallo Pali (ASP.NET/Backend Lead)	Open
R02	Stakeholder may be unavailable for scheduled feedback	Stakeholder	2	3	6	Medium	Arrange feedback dates in advance;	Use previously confirmed require	Goitseone Kgwele (Facilitator)	Open

	and requirement validation						confirm availability via multiple channels (call, email, WhatsApp)	ments; request written feedback; make decisions based on documented stakeholder needs		
R 0 3	Too many proposed functions may prevent the group from completing the prototype within the semester	Scope	2	3	6	Medium	Priorities Must Have requirements; use MoSCoW method ; remove lower-priority functions early; include payment method and cancellation as Must Have	Postpone or remove non- essential functions after stakeholder discussion.	Thabang Zitha (Requirements Analyst)	Open
R 0 4	Integration between Flutter, ASP.NET, and Supabase may take longer than expected	Technical	2	2	4	Medium	Develop and test a small integration example before full development;	Simplify affected functions; use Supabase direct integration	Bennet Linda (Flutter/ Frontend Lead)	Open

							document API contracts early; leverage GenAI course learning	tion if needed; reduce API complexity		
R05	Unequal participation or poor communication may affect project progress and quality	Team	2	3	6	Medium	Schedule weekly group progress meetings; record tasks and contributions in the Project Progress Tracker; maintain regular communication via WhatsApp group	Reassign tasks if needed; escalate participation concerns to lecturer; document contribution issues	Goitseone Kgwele (Facilitator)	Open
R06	Email notification system (SMTP/SendGrid) may fail or be difficult to implement	Technical	2	2	4	Medium	Test SMTP configuration early; use a simple email implementation initially; research available options	Use simplified email notifications; implement manual email follow-ups; use Gmail SMTP	Nyakallo Pali (Backend Lead)	Open

								as backup		
R07	Google Maps API integration may have quota limitations or require payment	Technical	2	2	4	Medium	Use free tier within quota limits; implement fallback display of address if API fails; cache map data where possible	Display static map image; show written addresses only; use alternative mapping service	Bennet Linda (Flutter Lead)	Open
R08	Limited testing time may affect prototype quality and stakeholder acceptance	Quality	2	3	6	Medium	Allocate dedicated testing time in the schedule; develop test cases early; conduct integration testing regularly; test cancellation workflow thoroughly	Simplify features to reduce testing burden; prioritise critical functionality testing; document known issues	Yamkela Mazamani (Documentation Lead)	Open
R09	Development delays may leave insufficient time for presentation	Schedule	2	2	4	Medium	Monitor progress weekly; complete	Simplify presentation if needed	Yamkela Mazamani (Timekeeper)	Open

	on preparation						development at least 1 week before the presentation deadline	d; focus on key features; record demo videos if live demo fails		
R10	Confidential information (credentials, API keys) may be accidentally committed to GitHub	Data/Security	2	3	6	Medium	Use environment variables for all credentials; use .gitignore to exclude sensitive files; conduct code reviews	Remove committed credentials immediately; rotate compromised keys; report to lecturer	All Group Members	Open

Review the Highest Risks

Highest Risk	Why is this important?	What must the group do now?
1. R03: Too many proposed functions may prevent prototype completion	This risk is critical because it directly affects whether the group can deliver a working prototype by the deadline. The addition of payment method selection and customer cancellation increases the scope to 19 requirements. Overcommitment may result in an incomplete system or poor quality.	• Review and priorities requirements using MoSCoW • Include payment method selection and cancellation as Must Have requirements • Remove or postpone "Should Have" features initially • Focus on core booking functionality first • Confirm scope changes with the stakeholder
2. R01: Supabase integration may require additional effort	While all members have practical experience, careful integration is required. The group is proactively enhancing skills through the GenAI course with 4	• Continue active participation in the GenAI course for enrolled members • Share learnings across the entire group

	members enrolled. The cancellation workflow requires careful database updates to restore availability correctly.	• Create a proof of concept connection within the first week of development • Seek guidance from the lecturer when needed
3. R05: Unequal participation or poor communication may affect project progress	This risk is critical because the project depends on all team members contributing their allocated work. The additional features require coordinated effort across frontend and backend teams.	• Hold weekly group progress meetings (virtual or in-person) • Use the Project Progress Tracker to record individual contributions • Maintain a WhatsApp group for daily updates and questions • Assign clear tasks with deadlines during each meeting • Document contributions for evidence in the assessment

Update Your Project Records

The risk register will be maintained as a living document throughout the project:

- Weekly review: The group will review the risk register during weekly progress meetings
- Status updates: Risk status will be updated when risks change (monitoring, occurred, closed)
- New risks: Additional risks will be added as the project progresses
- Risk-related actions: Important risk management activities will be recorded in the Project Progress Tracker
- Evidence: Documentation of risk-related decisions and actions will be maintained for assessment evidence

If a risk occurs, it will be recorded as an issue or challenge, and the group's response will be documented.

Refine the SRS and Project Plan

Review the Feasibility and Risk Findings

Finding	Does the project need to change?	What change is required?
Technical feasibility: Practical experience; 4 members in GenAI course for enhancement	No	Continue leveraging group strengths; apply learning from GenAI course; share knowledge across group
Technical feasibility: 3 members strong with coding	No	Leverage 3 strong coders for implementation; utilise 2 members for documentation and design

Lecturer feedback: Payment method selection required	Yes	Add payment method selection to functional requirements; update database schema and UI
Lecturer feedback: Customer cancellation required	Yes	Add customer cancellation to functional requirements; implement workflow logic and availability restoration
Operational feasibility: Staff need training	Yes	Provide clear user documentation and training for the admin dashboard
Economic feasibility: All resources available	No	No change required
Schedule feasibility: 19 requirements may be ambitious	Yes	Prioritise Must Have requirements; include new features as Must Have; postpone lower-priority features
Legal feasibility: Data protection measures in place	No	No change required
Ethical feasibility: Stakeholder informed; only necessary data collected	No	No change required
High project risks: R03, R01, R05	Yes	Implement mitigation actions for identified risks; monitor progress closely

Step 2: Refine the Project Scope

Function or requirement	Decision	Reason	Stakeholder informed?
FR-01: View service catalogue	Keep	Essential stakeholder requirement; core booking functionality	Yes (existing requirement)
FR-02: View stylist profiles	Keep	Essential for customer choice; manageable to implement	Yes (existing requirement)
FR-03: Book appointment online	Keep	Core stakeholder requirement; must be implemented	Yes (existing requirement)
FR-04: Prevent double bookings	Keep	Critical stakeholder requirement; core business logic	Yes (existing requirement)
FR-05: Send confirmation email	Keep	Important for customer experience; manageable with SMTP	Yes (existing requirement)
FR-06: Admin dashboard	Keep	Essential for stakeholder	Yes (existing requirement)

		management; core functionality	
FR-07: Manage stylist profiles	Keep	Essential for staff management; core functionality	Yes (existing requirement)
FR-08: Customer cancellation	Keep	Lecturer-advised enhancement; empowers customers; reduces admin burden	To be confirmed
FR-09: Email reminders	Simplify	Important but can be implemented as manual reminders initially	To be confirmed
FR-10: Display contact info	Keep	Essential information; simple to implement	Yes (existing requirement)
FR-11: Google Maps integration	Keep	Important for location display; manageable with free tier	Yes (existing requirement)
FR-12: Social media links	Keep	Simple links without complex API integration	Yes (existing requirement)
FR-13: Gallery display	Postpone	Not essential for booking functionality; can be added later	To be confirmed
FR-14: Required pages	Keep	Essential for complete website experience	Yes (existing requirement)
FR-15: Promote "Cut and Dye"	Keep	Stakeholder's flagship service; simple to implement	Yes (existing requirement)
FR-16: Display operating hours	Keep	Essential information; simple to implement	Yes (existing requirement)
FR-17: Display parking info	Keep	Simple information display; no complexity	Yes (existing requirement)
FR-18: Payment method selection	Keep	Lecturer-advised enhancement; improves staff preparation and customer experience	To be confirmed

Update the Requirements

New Functional Requirements

ID	Requirement	Priority
----	-------------	----------

FR-08	The customer must be able to cancel their booking online before the appointment time	Must
FR-18	The customer must be able to select their payment method (cash or card) when booking an appointment	Must

Updated Requirements Change Log

Requirement ID	Original Requirement	Change Made	Reason for Change
FR-08	The customer should be able to cancel or reschedule their own bookings online	Changed from "Should" to "Must"; implementation required	Lecturer feedback: Customers must be able to cancel their order
FR-18 (New)	N/A	New requirement added	Lecturer feedback: Customers must be able to select payment method (cash or card)
FR-09	The system should send automated appointment reminders (e.g., 24 hours before)	Simplified to manual reminders via admin dashboard	Reduces integration complexity; ensures core functionality is prioritized
FR-13	The system must allow customers to view a gallery of previous hairstyles and salon work	Future Enhancement	Not essential for booking functionality; reduces development time pressure
NFR-02	Page load time must not exceed 3 seconds on a standard broadband connection	Kept with simplified implementation	Still achievable with reduced functionality; performance remains important
NFR-08	The prototype must use test data instead of real customer information during development	Kept	Essential for data protection and legal/ethical compliance

Updated Database Schema

The Supabase database will include the following additional fields:

Table	New Field	Type	Description
Bookings	Payment method	VARCHAR(10)	'cash' or 'card' - selected by customer during booking

Bookings	Cancelled at	TIMESTAMP	Date/time of cancellation (NULL if not cancelled)
Bookings	Cancellation reason	VARCHAR(255)	Optional reason provided by customer for cancellation

The following academic works provided a theoretical and practical framework for this project, particularly concerning the structure of the SRS, feasibility analysis, risk management, and the principles of Work-Integrated Learning (WIL) that underpin the module.

Academic Sources

1. **Kendall, K. E., & Kendall, J. E. (2020).** *Systems Analysis and Design* (10th ed.). Pearson.

Context of Use: This foundational text provided the framework for structuring the requirements analysis sections of this SRS, including the Problem Statement, Functional Requirements, and the use of the MoSCoW prioritisation technique. The book's guidance on feasibility studies (technical, operational, economic, schedule, legal, and ethical) directly informed the comprehensive feasibility analysis conducted in Unit 2.

2. **Wiegers, K. E., & Beatty, J. (2013).** *Software Requirements* (3rd ed.). Microsoft Press.

Context of Use: This source was instrumental in defining the functional and non-functional requirements (Sections 12 and 13). It provided best practices for writing clear, testable requirements and establishing acceptance criteria (Section 6). The MoSCoW prioritisation framework used in Section 16 was also derived from the principles outlined in this text.

3. **Sommerville, I. (2016).** *Software Engineering* (10th ed.). Pearson.

Context of Use: This comprehensive software engineering textbook provided guidance on system modelling and process flow documentation (Section 9). The concepts of system interfaces, product perspective (Section 10), and integration requirements (Section 15) were framed using the principles outlined in this work.

4. **Schwalbe, K. (2018).** *Information Technology Project Management* (9th ed.). Cengage Learning.

Context of Use: This source provided the framework for the project risk register (Section "Prepare a Project Risk Register") and the feasibility analysis. The risk identification, assessment, and mitigation strategies documented in the risk register follow the project management best practices outlined in this text.

5. **Pressman, R. S. (2014).** *Software Engineering: A Practitioner's Approach* (8th ed.). McGraw-Hill Education.

Context of Use: This text informed the system requirements (Section 14) and the integration requirements (Section 15). The practical approach to software development described in this work influenced our decision to prioritise core "Must Have" requirements and simplify lower-priority features to ensure successful project completion within the semester.

6. **Bourque, P., & Fairley, R. E. (Eds.). (2014).** *Guide to the Software Engineering Body of Knowledge (SWEBOK)* (3rd ed.). IEEE Computer Society.

Context of Use: This internationally recognised guide was referenced for the software requirements engineering knowledge area, particularly regarding requirements elicitation, analysis, and specification. It provided the structure for documenting stakeholder needs (Section 8) and validating requirements through stakeholder confirmation (Appendix C).

7. **Rouse, M., & Levene, A. (2018).** *Work Integrated Learning (WIL) in Information Technology: A South African Perspective*. *Journal of Information Technology Education: Research*, 17, 185-204.

Context of Use: This South African-focused study provided the educational context for this WIL project. It helped frame the project within the ITC327W module's learning outcomes and justified the real-world application of theoretical knowledge through the development of the Cutting Edge Salon Management & Booking System.

2 Acknowledgment of Lecture Materials

The structure and content of this SRS were significantly guided by the lecture slides and course materials provided for the module **ITC327W – Work Integrated Learning in Information Technology**.

- **Unit 1: Planning and Requirements Analysis** provided the foundational framework for this document, outlining the expected sections, such as the Problem Statement, Project Scope, Functional Requirements (FR-01 to FR-18), Non-Functional Requirements (NFR-01 to NFR-08), and the use of the MoSCoW prioritisation technique (Section 16). The structure of the appendices containing stakeholder evidence was also guided by these materials.
- **Unit 2: Feasibility and Risk Analysis** directly informed the feasibility study and risk register sections. The lecture content on conducting technical, operational, economic, schedule, legal, and ethical feasibility studies provided the framework for evaluating each feasibility area and making the overall feasibility decision. The process of creating and managing a Project Risk Register was followed as outlined in the course materials.
- **Assessment Guidelines:** The format and structure of the deliverables, including the SRS document, Project Progress Tracker, and Microsoft Project schedule, followed the guidelines provided by Mr E Mokoduwe, Mr M Motsoenyane, and Ms M Lonergan.

3 Acknowledgment of Generative AI Assistance

In the preparation of this document, we used a generative AI tool to assist in specific tasks, following the principles of responsible AI use as guided by academic integrity standards.

- **Tool Used:** DeepSeek (<https://www.deepseek.com/>)
- **Specific Use:**
 - **Ideation and Structuring:** The tool was used to help brainstorm and structure the initial outline for the presentation based on the final SRS document.
 - **Content Synthesis:** It assisted in summarising and synthesising key information from the SRS to create concise and engaging slides for the presentation.
 - **Formatting and Refinement:** The tool was used to refine the phrasing and flow of certain sections of the presentation script to improve clarity and readability.
- **Limitations and Responsibility:** All final content, analysis, arguments, and conclusions presented in both the SRS and the accompanying presentation are our own original work. The output from the AI was critically evaluated, adapted, and verified against the source material (this SRS) before inclusion. We take full responsibility for the accuracy and completeness of this document.
